Bitmask Tricks

Operations

$$a+b=a\oplus b+2(a\&b)$$

$$a+b=a|b+a\&b$$

$$a\oplus b=a|b-a\&b$$

Notes

- 1. Kth bit is set in x iff $x \mod 2^{k-1} \ge 2^k$. It comes handy when you need to look at the bits of the numbers which are pair sums or subset sums, etc.
- 2. Kth bit is set in x iff $x \mod 2^{k-1} x \mod 2^k \neq 0$ (= 2^k to be exact).
- 3. $n \mod 2^i = n \& (2^i 1)$
- 4. $1 \oplus 2 \oplus 3 \oplus \cdots \oplus (4k-1) = 0$ for any $k \ge 0$

Shortcuts

1. Counting Set Bits (Hamming Weight):

```
__builtin_popcount(x) = int
__builtin_popcount1(x) = long int
__builtin_popcount11(x) = long long
```

2. Lowest Set Bit:

3. Turn Off the Lowest Set Bit:

4. Check if x is a Power of Two:

$$(x & (x - 1)) == 0$$

5. Generate All Subsets of a Set:

for mask in range(1 << n):</pre>

6. Set/Unset k-th Bit:

7. Flip All Bits:

~ X

8. Modulo with Power of Two:

$$x \% (1 \ll k) = x & (2^k - 1)$$

9. Gray Code:

$$gray(n) = n (n >> 1)$$

10. Binary Representation of a Number:
