while (q--) {
    cin >> 1 >> r;
   // answer the number of intervals (X, Y) X <= Y that are included
        between L. R
   cout << rangesPrefix[r][l] - rangesPrefix[l - 1][l] << el;</pre>
}
```

#### 4.2.2 Find subarrays intervals that sum to K Using Map

#### Find subarray intervals that sum to K Using Map

```
int n, k;
cin >> n >> k;
vector<int> a(n + 1);
vector<pair<int, int>> rng;
for (int i = 1; i <= n; ++i)</pre>
    cin >> a[i];
map<int, set<int>> prev;
int currSum = 0:
for (int i = 1; i <= n; ++i) {</pre>
    currSum += a[i];
   if (currSum == k) {
       rng.push_back({1, i});
   if (prev.find(currSum - k) != prev.end()) {
       for (auto &j : prev[currSum - k]) {
           rng.push_back(\{j + 1, i\});
       }
   }
    prev[currSum].insert(i);
}
```

#### 4.3 Ad-hoc

# 4.3.1 Find duplicate

# Find duplicate using XOR

```
int findDuplicate(int arr[] , int n)
{
   int answer=0;
    //XOR all the elements with 0
   for(int i=0; i<n; i++){
      answer=answer^arr[i];
   }
   //XOR all the elements with no from 1 to n
   // i.e answer^0 = answer</pre>
```

```
for(int i=1; i<n; i++){
    answer=answer^i;
}
return answer;
}</pre>
```

# 4.4 Sorting Algorithms

#### 4.4.1 Radix Sort

#### Radix Sort

```
// O(n + b), where n is the number of elements and b is the base of the
   number system
// A function to do counting sort of arr[] according to the digit
    represented by exp.
void countingSort(vector<int>& arr, int exp) {
   int n = arr.size();
   vector<int> output(n); // output array
   int count[10] = {0};
   // Store count of occurrences in count[]
   for (int i = 0; i < n; i++)</pre>
       count[(arr[i] / exp) % 10]++;
   // Change count[i] so that count[i] now contains the actual
   // position of this digit in output[]
   for (int i = 1; i < 10; i++)</pre>
       count[i] += count[i - 1];
   // Build the output array
   for (int i = n - 1; i \ge 0; i--) {
       output[count[(arr[i] / exp) % 10] - 1] = arr[i];
       count[(arr[i] / exp) % 10]--;
   }
   // Copy the output array to arr[], so that arr now
   // contains sorted numbers according to the current digit
   for (int i = 0; i < n; i++)</pre>
       arr[i] = output[i];
```

#### 4.4.2 Counting Sort

#### Counting Sort

```
// O(N+M), where N and M are the size of inputArray[] and countArray[]
// The main function that sorts arr[] of size n using Counting Sort
void countingSort(vector<int>& arr) {
   int maxElement = *max_element(arr.begin(), arr.end());
   int minElement = *min_element(arr.begin(), arr.end());

   prime.push_back(2);
   for (int j = 4; j < sz; j += 2) vis[j] = true;
   for (int i = 3; i < sz; i += 2) {
       if (vis[i]) continue;
       prime.push_back(i);
       for (int j = i * i; j < sz; j += i) vis[j] = true;</pre>
}
// Preprocessing Prime Factorization of range numbers
constexpr int N = 5e6+1;
int a[N];
for(int i=2; i < N; ++i) {</pre>
   if(!a[i]) {
       for(int j=1; i*j < N; ++j) {</pre>
           for(int k=i*j; k%i==0; k/=i) a[i*j]++;
   a[i] += a[i-1];
}
```

## 9.3 Math

# 9.3.1 Vieta's Formula for a Polynomial of Degree n

**Problem**: Given a polynomial of degree n:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$$

with roots  $r_1, r_2, \ldots, r_n$ , express the sums and products of its roots using Vieta's formulas.

**Solution**: Using Vieta's formulas, we can relate the coefficients of the polynomial to sums and products of its roots:

• Sum of the roots taken one at a time:

$$r_1 + r_2 + \dots + r_n = -\frac{a_{n-1}}{a_n}$$

• Sum of the products of the roots taken two at a time:

$$r_1r_2 + r_1r_3 + \dots + r_{n-1}r_n = \frac{a_{n-2}}{a_n}$$

• Sum of the products of the roots taken three at a time:

$$r_1 r_2 r_3 + r_1 r_2 r_4 + \dots + r_{n-2} r_{n-1} r_n = -\frac{a_{n-3}}{a_n}$$

- Continue this pattern until:
- Product of the roots (for even n):

$$r_1 r_2 \cdots r_n = (-1)^n \frac{a_0}{a_n}$$

#### Example Problem Using Vieta's Formula

**Problem**: Given a quadratic equation  $x^2 + bx + c = 0$  with roots  $r_1$  and  $r_2$ , find  $r_1 + r_2$  and  $r_1r_2$ .

**Solution**: Using Vieta's formulas for a quadratic equation  $ax^2 + bx + c = 0$ :

• Sum of the roots:

$$r_1 + r_2 = -\frac{b}{a}$$

• Product of the roots:

$$r_1 r_2 = \frac{c}{a}$$

For the given quadratic  $x^2 + bx + c = 0$  (where a = 1):

**Also:** To find the roots of the quadratic equation, we can use the discriminant formula,  $D = b^2 - 4ac$ . The roots will then be  $x_1 = \frac{b - \sqrt{D}}{2}$  and  $x_2 = \frac{b + \sqrt{D}}{2}$ .

- $r_1 + r_2 = -b$
- $r_1r_2 = 0$

## Example Vieta's Formula for Cubic Equation

When considering a cubic equation in the form of  $f(x) = ax^3 + bx^2 + cx + d$ , Vieta's formula states that if the equation f(x) = 0 has roots  $r_1, r_2$ , and  $r_3$ , then:

- $r_1 + r_2 + r_3 = -\frac{b}{a}$
- $r_1 r_2 + r_2 r_3 + r_3 r_1 = \frac{c}{a}$
- $\bullet \ r_1 r_2 r_3 = -\frac{d}{a}$

## 9.4 Phi Function

- Count integers i < n such that gcd(i, n) = 1
- $gcd(a, b) = 1 \Rightarrow then coprimes: gcd(5, 7), gcd(4, 9)$
- gcd(prime, i) = 1 for i < prime
- $\varphi(10) = 4 \Rightarrow 1, 3, 7, 9$
- $\varphi(5) = 4 \Rightarrow 1, 2, 3, 4 \dots \varphi(\text{prime}) = \text{prime} 1$
- If a, b, c are pairwise coprimes, then

$$\varphi(a \cdot b \cdot c) = \varphi(a) \cdot \varphi(b) \cdot \varphi(c)$$

• If k > 1

$$\varphi(p^k) = p^k - p^{k-1} = p^{k-1}(p-1) = p^k \left(1 - \frac{1}{p}\right)$$

# **Euler's Totient Numbers**

# Online Sequence

•  $\varphi(1) = \varphi(2) = 1, \ \varphi(5) = 4$ 

- $\varphi(n)$  is even for n > 2
- $\sqrt{n} \le \varphi(n) \le n \sqrt{n}$ : Except 2, 6
- $\varphi(n^k) = n^{k-1} \cdot \varphi(n)$
- $n = \sum \varphi(d_i)$  where d are the divisors of n

# 9.5 Möbius Function

#### Möbius Function

```
int mobius(int n) {
   int p = 0;
   // Handling 2 separately
   if (n\%2 == 0){
       n = n/2;
       p++;
       // If 2^2 also divides N
       if (n % 2 == 0)
          return 0;
   }
   // Check for all other prime factors
   for (int i = 3; i <= sqrt(n); i = i+2) {</pre>
       if (n\%i == 0){
           n = n/i;
           p++;
           if (n % i == 0) return 0;
   }
void mobius_generator() const {
 const int MAX = 1000000;
 int moebius[MAX + 1];
 for (ll i = 2; i <= MAX; i++)</pre>
```

```
moebius[i] = -1, prime[i] = 1;

for (ll i = 2; i <= MAX; ++i)
   if (prime[i]) {
      moebius[i] = 1;

      for (ll j = 2 * i; j <= MAX; j += i)
            prime[j] = 0, moebius[j] = j % (i * i) == 0 ? -moebius[j] : 1;
      }
}

// Mobius Inclusion Exclusion
// Count triples gcd(a, b, c) = 1
int n = 4;
ll sum = n * n * n;
for (ll i = 2; i <= n; ++i)
      sum -= moebius[i] * (n / i) * (n / i) * (n / i);</pre>
```

# Möbius and Inclusion Exclusion

Count the triples (a, b, c) such that  $a, b, c \le n$ , and gcd(a, b, c) = 1

- Reverse thinking, total (# triples gcd > 1)
- How many triples with gcd multiple of 2:  $(n/2)^3$
- How many triples with gcd multiple of 3:  $(n/3)^3$
- and 4? Ignore any numbers of internal duplicate primes
- and 6? already computed in 2, 3. Remove it:  $-(n/6)^3$

# Totient and Möbius Connection

Sum over divisors d of n

$$\sum_{d} d\mu \left(\frac{n}{d}\right) = \varphi(n)$$

# 10 Geometry

# 10.1 Linearity

# 10.1.1 co-linear points

#### check if two points are co-linear

```
