## 1.1 Setup

### 1.1.1 IO Manipulation

***Input/Output***

```cpp
#include <bits/stdc++.h>

freopen("input.txt", "r", stdin);
freopen("output.txt", "w", stdout);

#define fastIO              \
  ios_base::sync_with_stdio(false), cin.tie(nullptr), cout.tie(nullptr);
```

### 1.1.2 GCC Compiler Optimization (Vectorization)

***GCC Opt***

```cpp
// Ref: USACO guide
// will make GCC auto-vectorize for loops and optimizes floating points
    better (assumes associativity and turns off denormals).
#pragma GCC optimize ("Ofast")
// can double performance of vectorized code, but causes crashes on old
    machines.
#pragma GCC target ("avx,avx2,fma")

// slows down run time but throws a Runtime Error if an overflow occured
#pragma GCC optimize("trapv")
```

## 1.2 MOD Template

```cpp
constexpr int MOD = 1e9+7; // must be a prime number

int add(int a, int b) {
    int res = a+b;
    if(res >= MOD) return res -= MOD;
}
```

```cpp
int sub(int a, int b) {
    int res = a-b;
    if(res < 0) return res += MOD;
}

int power(int a, int e) {
    int res = 1;
    while(e) {if(e & 1) res = res * a % MOD; a = a * a % MOD;
    e >>= 1;}
    return res;
}

int inverse(int a) {
    return power(a, MOD-2);
}

int div(int a, int b) {
    return a * inverse(b) % MOD;
}
```

***MOD Template***

## 1.3 Macros

***Macros***

```cpp
#define getBit(n, k) (n >> k)
#define ON(n, idx) (n | (1ll << idx))
#define OFF(n, idx) (n & ~(1ll << idx))
#define toggle(n, idx) ((n) ^ (1ll<<(idx)))
#define gray(n) (n ^ (n >> 1))
#define bitCount(x) (__builtin_popcountll(x))
#define clz(x) (__builtin_clzll(x))
#define ctz(x) (__builtin_ctzll(x))
#define uniq(x) x.resize(unique(x.begin(), x.end())-x.begin());

#define angle(a) (atan2((a).imag(), (a).real()))
//#define vec(a, b) ((b)-(a))
#define same(v1, v2) (dp(vec(v1,v2),vec(v1,v2)) < EPS)
#define dotProduct(a, b) ((conj(a)*(b)).real()) // a*b cos(T), if zero ->
    prep
```

```cpp
#define crossProduct(a, b) ((conj(a)*(b)).imag()) // a*b sin(T), if zero
    -> parallel
//#define length(a) (hypot((a).imag(), (a).real()))
#define normalize(a) ((a)/length(a))
#define rotate0(v, ang) ((v)*exp(point(0,ang)))
#define rotateA(p, ang, about) (rotate0(vec(about,p),ang)+about)
#define reflect0(v, m) (conj((v)/(m))*(m))
#define ceil_i(a, b) (((ll)(a)+(ll)(b-1))/(ll)(b))
#define floor_i(a, b) (a/b)
#define round_i(a, b) ((a+(b/2))/b) // if a>0
#define round_m(a, b) ((a-(b/2))/b) // if a<0
#define round_multiple(n, m) round_i(n,m)*m // round to multiple if
    specified element

const double PI = acos(-1.0);
```

## 1.4 Grid Navigation

***Grid Nav***

```cpp
// knight moves on a chess board
int dx[] = { -2, -1, 1, 2, -2, -1, 1, 2 };
int dy[] = { -1, -2, -2, -1, 1, 2, 2, 1 };

// Grid up, down, right, left (Moves for Chess Rook)
int dx[4] = {1, -1, 0, 0};
int dy[4] = {0, 0, 1, -1};

// Grid cell all neighbours
const int dx[8] = {1, 0, -1, 0, 1, 1, -1, -1}
const int dy[8] = {0, 1, 0, -1, -1, 1, -1, 1};

// Grid Diagonal (Moves for Chess Bishop)
int dx[] = {1, 1, -1, -1};
int dy[] = {1, -1, 1, -1};
```

## 1.5 Integer 128

### i128

```cpp
typedef __int128 i128;

__int128 read() {
    __int128 x = 0, f = 1;
    char ch = getchar();
    while (ch < '0' || ch > '9') {
        if (ch == '-') f = -1;
        ch = getchar();
    }
    while (ch >= '0' && ch <= '9') {
        x = x * 10 + ch - '0';
        ch = getchar();
    }
    return x * f;
}

void print(__int128 x) {
    if (x < 0) {
        putchar('-');
        x = -x;
    }
    if (x > 9) print(x / 10);
    putchar(x % 10 + '0');
}

bool cmp(__int128 x, __int128 y) { return x > y; }
```

## 2 Dynamic Programming

### 2.1 Some dp patterns

#### *Maximumu/Minimum path cost*

```cpp
const int MAX = 21;
int grid[MAX][MAX];
int mem[MAX][MAX];
int n = 20;
bool valid(int r, int c){
  return r >= 0 && r < n && c >= 0 && c < n;
}
```

```cpp
}

int maxPathSum(int r, int c){
    if(!valid(r,c)){
        return 0;
    }

    if(r == n-1 && c == n-1){
        return mem[r][c] = grid[r][c];
    }
    // available moves
    int path1 = maxPathSum(r+1,c);
    int path2 = maxPathSum(r,c+1);

    return grid[r][c] + max(path1,path2);
}
```

#### *add operators between numbers to get max prod/sum*

```cpp
// put +, -, between sequence of numbers such that the sum is divisible by
    k, and maximum as possible
const int MAX = 21;
long long mem[MAX][MAX];
const int n = 20;
int k = 4; // example
int v[20];
int fix(int a){
  return (a % k + k) % k;
}
long long tryAll(int pos, int mod){
    long long &ret = mem[pos][mod];
    if(ret != -1){
        return ret;
    }
    if(pos == n){
        return ret = mod == 0;
    }
    if(tryAll(pos+1,fix(mod + v[pos])) || tryAll(pos+1,fix(mod-v[pos]))){
        return ret = 1;
    }
    return ret = 0;
}
```

### *pick choices with no two similar consecutive choices*

```cpp
// pick minimum of choinces costs with no two similar consecutive choices
const int choices = 4;
const int n = 20;
int MAX = n;
int mem[MAX][choices];
const int OO = 1e6+1;
int minCost(int pos, int lastChoice){
    if(pos == n){
        return 0; // invalid move
    }
    int &ret = mem[pos][lastChoice];

    if(ret != -1){
        return ret;
    }

    ret = OO; // want to minimze
    // let choices are 0, 1, 2
    if(lastChoice != 0){
        ret = min(ret, minCost(pos+1,0));
    }
    if(lastChoice != 1){
        ret = min(ret, minCost(pos+1,1));
    }
    if(lastChoice != 2){
        ret = min(ret, minCost(pos+1,2));
    }
    return ret;
}
```

### *sum S and max/min Product*

```cpp
int maxK;

ll mem[21][101]; // k, and s

// You are given an integer s and an integer k. Find k positive integers
    a1, a2, ..., ak
// such that their sum is equal to s and their product is the maximal
    possible. Return their product.
```

```cpp
ll maxProd(int k, int rem)
{
 if(k == maxK){
  // base case
  if(rem == 0)
   return 1;
  return 0;
 }

 if(rem == 0) // invalid case
  return 0;

 ll &ret = mem[k][rem];

 if(ret != -1)
  return ret;

 ret = 0;

 for (int i = 1; i <= rem; ++i) {
  ll sol = maxProd(k+1, rem - i) * i;
  ret = max(ret, sol);
 }

 return ret;
}
```

## 2.2 DP solutions

### 2.2.1 Max Subarray sum (Kadane's Algorithm)

### *Max Subarray sum*

```cpp
int maxSubarraySum(vector<int>& arr, int len) {
    int ans = INT_MIN, cur = 0;

    for (int i = 0; i < len; i++) {
        cur = cur + arr[i];
        if (ans < cur)
            ans = cur;

        if (cur < 0)
```

```
        cur = 0;
    }

    return ans;
}
```

---

### 2.2.2 Maximum Subarray Alternating Sum

#### *Maximum Subarray Alternating Sum*

```cpp
/* REF: GeeksForGeeks
 Input: arr[] = {-4, -10, 3, 5}
 Output: 9
 Explanation: Subarray {arr[0], arr[2]} = {-4, -10, 3}. Therefore, the sum
     of this subarray is 9.
*/
int maxSubarraySumALT(vector<int>& a, int len) {
    int ans = INT_MIN, cur = 0;
    for (int i = 0; i < len; i++) {
        if (i % 2 == 0)
            cur = max(cur + a[i], a[i]);
        else
            cur = max(cur - a[i], -a[i]);

        ans = max(ans, cur);
    }

    cur = 0;

    for (int i = 0; i < len; i++) {
        if (i % 2 == 1)
            cur = max(cur + a[i], a[i]);
        else
            cur = max(cur - a[i], -a[i]);

        ans = max(ans, cur);
    }

    return ans;
}
```

### 2.2.3 Count number of DISTINCT ordered ways to produce coins sums to x

#### *Count distinct*

```cpp
/*
For example, if the coins are \{2,3,5\} and the desired sum is 9, there
    are 3 ways:

2+2+5
3+3+3
2+2+2+3
*/
int n, x;
cin >> n >> x;
vector<int> coins(n);
read(coins);

vector dp(x + 1, 0);

dp[0] = 1;
for (int i = 0; i < n; ++i) {
 for (int j = coins[i]; j <= x; ++j) {
  dp[j] = add(dp[j], dp[j - coins[i]]);
 }
}

cout << dp[x] << el;
```

---

### 2.2.4 Min absolute difference between 2 elements from (L, R) (DP Ranges)

#### *Min absolute difference*

```cpp
const int N = 1e4 + 1;

int dp[N][N];

int n;
cin >> n;
vector<int> a(n);
read(a);
```

```cpp
for (int i = 0; i < n; ++i) dp[i][i] = 1e6; // INF, you can't take the
    element with it self
for (int i = 1; i < n; ++i) dp[i - 1][i] = abs(a[i] - a[i - 1]);

for (int len = 3; len <= n; ++len) {
 for (int l = 0, r = len - 1; r < n; ++l, ++r) {
  dp[l][r] = min(dp[l][r - 1], dp[l + 1][r]);
  dp[l][r] = min(dp[l][r], abs(a[l] - a[r]));
 }
}

int q;
cin >> q;
while (q--) {
 int l, r;
 cin >> l >> r;
 --l, --r;

 cout << dp[l][r] << el;
}
```

### 2.2.5   Longest common subsequence between 2 Strings

$$dp[i][j] = \begin{cases} \max(dp[i-1][j], dp[i][j-1]) & \text{if } A_i \neq B_j \\ dp[i-1][j-1] + 1 & \text{if } A_i = B_j \end{cases}$$

***LIS 2 Strings***

```cpp
// REF: USACO guide
int longestCommonSubsequence(string a, string b) {
 int dp[a.size()][b.size()];
 for (int i = 0; i < a.size(); i++) { fill(dp[i], dp[i] + b.size(), 0); }
 for (int i = 0; i < a.size(); i++) {
  if (a[i] == b[0]) dp[i][0] = 1;
  if (i != 0) dp[i][0] = max(dp[i][0], dp[i - 1][0]);
 }
 for (int i = 0; i < b.size(); i++) {
  if (a[0] == b[i]) dp[0][i] = 1;
  if (i != 0) dp[0][i] = max(dp[0][i], dp[0][i - 1]);
 }
 for (int i = 1; i < a.size(); i++) {
  for (int j = 1; j < b.size(); j++) {
```

```cpp
   if (a[i] == b[j]) {
    dp[i][j] = dp[i - 1][j - 1] + 1;
   } else {
    dp[i][j] = max(dp[i - 1][j], dp[i][j - 1]);
   }
  }
 }
 return dp[a.size() - 1][b.size() - 1];
}
```

## 3   Bit Manipulation

### 3.1   Subset Operations

***count subsets with give sum***

```cpp
int countDistinctSubsetsWithSum(vector<int>& arr, int n, int k) {
    // Count distinct subsets of array arr that sum up to k
    vector<int> dp(k + 1, 0);
    dp[0] = 1;
    for (int i = 0; i < n; ++i) {
        for (int j = k; j >= arr[i]; --j) {
            dp[j] += dp[j - arr[i]];
        }
    }
    return dp[k]; // Number of distinct subsets with sum k
}
```

***max xor of any subset of elements in the array***

```cpp
int maximalSubsetXOR(vector<int>& arr, int n) {
    // Find the maximum XOR of any subset of elements in array arr
    int maxXor = 0;
    for (int mask = 0; mask < (1 << n); ++mask) {
        int xorSum = 0;
        for (int i = 0; i < n; ++i) {
            if (mask & (1 << i)) {
                xorSum ^= arr[i];
            }
        }
```

```cpp
        maxXor = max(maxXor, xorSum);
    }
    return maxXor;
}
```

---

### *min xor of any subset*

```cpp
int minimumSubsetXOR(vector<int>& arr, int n) {
    // Find the minimum XOR of any pair of elements in array arr
    int minSubsetXor = INT_MAX;
    for (int mask = 0; mask < (1 << n); ++mask) {
        int xorSum = 0;
        for (int i = 0; i < n; ++i) {
            if (mask & (1 << i)) {
                xorSum ^= arr[i];
            }
        }
        minSubsetXor = min(minSubsetXor, xorSum);
    }
    return minSubsetXor;
}
```

---

### *subset generation*

```cpp
void subsetGeneration(int x, int n) {
    // Generate all non-empty subsets of a set represented by an integer x
    for (int subset = x; subset > 0; subset = (subset - 1) & x) {
        // Process subset
        cout << subset << endl;
    }
}
```

---

### *check if subset of elements in the array sum up to k*

```cpp
void subsetSumCheck(vector<int>& arr, int n, int k) {
    // Check if a subset of elements in array arr sums up to k
    for (int subset = 0; subset < (1 << n); ++subset) {
        int sum = 0;
        for (int i = 0; i < n; ++i) {
            if (subset & (1 << i)) {
```

```cpp
                sum += arr[i];
            }
        }
        if (sum == k) {
            // Found subset with sum k
            cout << "Subset with sum " << k << ": " << subset << endl;
        }
    }
}
```

---

### *max subset sum mod m*

```cpp
int subsetWithMaxSumModuloM(vector<int>& arr, int n, int m) {
    // Find the maximum subset sum modulo m
    vector<int> dp(m, -1);
    dp[0] = 0;
    int currentMod = 0;
    for (int i = 0; i < n; ++i) {
        currentMod = (currentMod + arr[i]) % m;
        for (int j = 0; j < m; ++j) {
            if (dp[j] != -1) {
                dp[(j + currentMod) % m] = max(dp[(j + currentMod) % m], dp
                    [j] + arr[i]);
            }
        }
        dp[currentMod] = max(dp[currentMod], arr[i]);
    }
    return dp[0]; // Maximum subset sum modulo m
}
```

---

### *iterate over all supersets represented by x*

```cpp
void iterateOverSupersets(int x, int n) {
    // Iterate over all supersets of a set represented by x
    int subset = x;
    do {
        // Process subset
        cout << subset << endl;
        subset = (subset + 1) | x;
    } while (subset <= (1 << n) - 1);
}
```

# 4    Algorithms

## 4.1    MO

### MO Algorithm

```cpp
// MO       -> O(N+Q SQRT(N)) <= 10^5

const int N = 1e5+5, M = 1e5+5;
int n, m;
int nums[N], q_ans[M];

struct query {
    int idx, block_idx, l, r;

    query() = default;
    query(int _l, int _r, int _idx) {
        idx = _idx;
        r = _r - 1;
        l = _l - 1;
        block_idx = _l / sqrt(n);
    }

    bool operator <(const query & y) const {
        if(y.block_idx == block_idx) return r < y.r;
        return block_idx < y.block_idx;
    }
};

int freq[N], ans;

void add(int idx) {
    freq[nums[idx]]++;
    if (freq[nums[idx]] == 2) ans++;
}

void remove(int idx) {
    freq[nums[idx]]--;
    if (freq[nums[idx]] == 1) ans--;
}

cin >> n >> m;
for (int i = 0; i < n; ++i) cin >> nums[i];
```

```cpp
vector<query> Query(m);
for (int i = 0; i < m; ++i) {
    int l, r; cin >> l >> r;
    Query[i] = query(l, r, i);
}

sort(Query.begin(), Query.end());
int l0 = 1, r0 = 0;
for (int i = 0; i < m; ++i) {
    while (l0 < Query[i].l) remove(l0++);
    while (l0 > Query[i].l) add(--l0);
    while (r0 < Query[i].r) add(++r0);
    while (r0 > Query[i].r) remove(r0--);
    q_ans[Query[i].idx] = ans;
}
for (int i = 0; i < m; ++i) {
    cout << q_ans[i] << '\n';
}
```

## 4.2    Intervals

### 4.2.1    Prefix Sum (L, R) intervals

### Prefix Sum (L, R) intervals

```cpp
// NOTE: works fine with small n or with large memory

int main() {
    int n, k;
    cin >> n >> k;

    vector<int> a(n + 1);
    vector<vector<int>> rangesPrefix(n + 1, vector<int>(n + 1, 0));
    for (int i = 1; i <= n; ++i)
        cin >> a[i];

    int l = 1, r = 1, sum = 0;
    // validate your intervals
    // here the intervals are the ones that have a sum of k
    while (r <= n) {
        sum += a[r];
```

```cpp
        while (sum > k) {
            sum -= a[l];
            ++l;
        }

        while (l <= r && a[l] == 0) {
            if (sum != k)
                break;

            rangesPrefix[r][l]++;

            ++l;
        }

        if (sum == k) {
            rangesPrefix[r][l]++;
        }

        ++r;
    }

    // prefix sum the columns
    for (int i = 1; i <= n; ++i) {
        for (int j = n - 1; j >= 0; --j) {
            rangesPrefix[i][j] += rangesPrefix[i][j + 1];
        }
    }

    // prefix sum the rows
    for (int i = 0; i <= n; ++i) {
        for (int j = 1; j <= n; ++j) {
            rangesPrefix[j][i] += rangesPrefix[j - 1][i];
        }
    }

    int q; cin >> q;

    while (q--) {
        cin >> l >> r;
        // answer the number of intervals (X, Y) X <= Y that are included
            between L, R
        cout << rangesPrefix[r][l] - rangesPrefix[l - 1][l] << el;
```

```cpp
    }
}
```

---

### 4.2.2 Find subarrays intervals that sum to K Using Map

*Find subarray intervals that sum to K Using Map*

```cpp
int n, k;
cin >> n >> k;

vector<int> a(n + 1);
vector<pair<int, int>> rng;
for (int i = 1; i <= n; ++i)
    cin >> a[i];

map<int, set<int>> prev;
int currSum = 0;

for (int i = 1; i <= n; ++i) {
    currSum += a[i];
    if (currSum == k) {
        rng.push_back({1, i});
    }
    if (prev.find(currSum - k) != prev.end()) {
        for (auto &j : prev[currSum - k]) {
            rng.push_back({j + 1, i});
        }
    }
    prev[currSum].insert(i);
}
```

---

## 4.3 Ad-hoc

### 4.3.1 Find duplicate

*Find duplicate using XOR*

```cpp
int findDuplicate(int arr[] , int n)
{
    int answer=0;
      //XOR all the elements with 0
```

```cpp
    for(int i=0; i<n; i++){
        answer=answer^arr[i];
    }
      //XOR all the elements with no from 1 to n
      // i.e  answer^0 = answer
    for(int i=1; i<n; i++){
        answer=answer^i;
    }
    return answer;
}
```

## 4.4  Sorting Algorithms

### 4.4.1  Radix Sort

<div align="center">

***Radix Sort***

</div>

```cpp
// O(n + b), where n is the number of elements and b is the base of the
    number system
// A function to do counting sort of arr[] according to the digit
    represented by exp.
void countingSort(vector<int>& arr, int exp) {
    int n = arr.size();
    vector<int> output(n); // output array
    int count[10] = {0};

    // Store count of occurrences in count[]
    for (int i = 0; i < n; i++)
        count[(arr[i] / exp) % 10]++;

    // Change count[i] so that count[i] now contains the actual
    // position of this digit in output[]
    for (int i = 1; i < 10; i++)
        count[i] += count[i - 1];

    // Build the output array
    for (int i = n - 1; i >= 0; i--) {
        output[count[(arr[i] / exp) % 10] - 1] = arr[i];
        count[(arr[i] / exp) % 10]--;
    }

    // Copy the output array to arr[], so that arr now
```

```cpp
    // contains sorted numbers according to the current digit
    for (int i = 0; i < n; i++)
        arr[i] = output[i];
}

// The main function to that sorts arr[] of size n using Radix Sort
void radixSort(vector<int>& arr) {
    // Find the maximum number to know the number of digits
    int mx = *max_element(arr.begin(), arr.end());

    // Do counting sort for every digit. Note that instead
    // of passing the digit number, exp is passed. exp is 10^i
    // where i is the current digit number
    for (int exp = 1; m / exp > 0; exp *= 10)
        countingSort(arr, exp);
}
```

### 4.4.2  Counting Sort

<div align="center">

***Counting Sort***

</div>

```cpp
// O(N+M), where N and M are the size of inputArray[] and countArray[]
// The main function that sorts arr[] of size n using Counting Sort
void countingSort(vector<int>& arr) {
    int maxElement = *max_element(arr.begin(), arr.end());
    int minElement = *min_element(arr.begin(), arr.end());
    int range = maxElement - minElement + 1;

    vector<int> count(range), output(arr.size());
    for (int i = 0; i < arr.size(); i++)
        count[arr[i] - minElement]++;

    for (int i = 1; i < count.size(); i++)
        count[i] += count[i - 1];

    for (int i = arr.size() - 1; i >= 0; i--) {
        output[count[arr[i] - minElement] - 1] = arr[i];
        count[arr[i] - minElement]--;
    }

    for (int i = 0; i < arr.size(); i++)
        arr[i] = output[i];
}
```

# 5 Data Structures

## 5.1 Strings

### 5.1.1 Trie (Prefix Tree)

*Basic Implementation*

```cpp
#define MAX_CHAR 26

struct TrieNode {
    TrieNode *pTrieNode[MAX_CHAR]{};
    bool isWord;

    TrieNode() {
        isWord = false;
        fill(pTrieNode, pTrieNode + 26, (TrieNode *) NULL);
    }

    virtual ~TrieNode() = default;
};

class Trie {
private:
    TrieNode *root;
public:
    Trie() {
        root = new TrieNode();
    }

    virtual ~Trie() = default;

    TrieNode *getTrieNode() {
        return this->root;
    }

    void insert(const string &word) {
        TrieNode *current = root;
        for (char c: word) {
            int i = c - 'a';

using namespace __gnu_pbds;

template<typename T>
using ordered_set = tree<T, null_type, less<T>, rb_tree_tag,
    tree_order_statistics_node_update>;

void erase_set(ordered_set &os, int v) {
    // Number of elements less than v
    int rank = os.order_of_key(v);

    auto it = os.find_by_order(rank);
    os.erase(it);
}
```

*Ordered Set*

# 6   Counting Principles

## 6.1   nCr

$$C(n, k) = \frac{n!}{(n-k)!k!} = \frac{n*(n-1)*(n-2)*\ldots*(n-k+1)}{k!}$$

### 6.1.1   Fast nCr

$$C(n, k) = \frac{n*(n-1)*(n-2)*\ldots*(n-k+1)}{1*2*3*\ldots*k} = \prod_{i=0}^{k-1}\frac{n-i}{i+1} = \prod_{i=0}^{k-1}(n-i)(i+1)^{-1}$$

*Fast nCr*

```cpp
int nCr(const int& n, const int& r) {
    double res = 1;
    for (int i = 1; i <= r; ++i)
        res = res * (n - r + i) / i;
    return (int)(res + 0.01);
}
```

### 6.1.2   Method 1:   Pascal's Triangle (Dynamic Programming) - $\mathcal{O}(n^2)$

*nCk using dp*

```cpp
// REF: USACO guide

/** @return nCk mod p using dynamic programming */
int binomial(int n, int k, int p) {
 // dp[i][j] stores iCj
 vector<vector<int>> dp(n + 1, vector<int>(k + 1, 0));

 // base cases described above
 for (int i = 0; i <= n; i++) {
  /*
   * i choose 0 is always 1 since there is exactly one way
```

```
   * to choose 0 elements from a set of i elements
   * (don't choose anything)
   */
  dp[i][0] = 1;
  /*
   * i choose i is always 1 since there is exactly one way
   * to choose i elements from a set of i elements
   * (choose every element in the set)
   */
  if (i <= k) { dp[i][i] = 1; }
 }

 for (int i = 0; i <= n; i++) {
  for (int j = 1; j <= min(i, k); j++) {
   if (i != j) { // skips over the base cases
    // uses the recurrence relation above
    dp[i][j] = (dp[i - 1][j - 1] + dp[i - 1][j]) % p;
   }
  }
 }

 return dp[n][k]; // returns nCk modulo p
}
```

```
  x = x * x % m;
  n /= 2;
 }
 return res;
}

/** Precomputes n! from 0 to MAXN. */
void factorial(long long p) {
 fac[0] = 1;
 for (int i = 1; i <= MAXN; i++) { fac[i] = fac[i - 1] * i % p; }
}

/**
 * Precomputes all modular inverse factorials
 * from 0 to MAXN in O(n + log p) time
 */
void inverses(long long p) {
 inv[MAXN] = exp(fac[MAXN], p - 2, p);
 for (int i = MAXN; i >= 1; i--) { inv[i - 1] = inv[i] * i % p; }
}

/** @return nCr mod p */
long long choose(long long n, long long r, long long p) {
 return fac[n] * inv[r] % p * inv[n - r] % p;
}

int main() {

  cin >> a >> b;
  cout << choose(a, b) << '\n';
 }
}
```

### 6.1.3 Method 2: Factorial Definition (Modular Inverses) - $\mathcal{O}(n + \log MOD)$

#### *nCk using Modular Inverses*

```
// REF: USACO guide

const int MAXN = 1e6;

long long fac[MAXN + 1];
long long inv[MAXN + 1];

/** @return x^n modulo m in O(log p) time. */
long long exp(long long x, long long n, long long m) {
 x %= m; // note: m * m must be less than 2^63 to avoid ll overflow
 long long res = 1;
 while (n > 0) {
  if (n % 2 == 1) { res = res * x % m; }
```

# 7 Graph Theory

## 7.1 Shortest Path algorithms

### 7.1.1 Dijkstra Algorithm

#### *Dijkstra Implementation*

```cpp
#define INF (1e18) // for int defined as ll

int n, m;
vector<vector<pair<int, int>>> adj;
vector<int> cost;
vector<int> parent;

void dijkstra(int startNode = 1) {
    priority_queue<pair<ll, int>, vector<pair<ll, int>>, greater<>> pq;

    cost[startNode] = 0;
    pq.emplace(0, startNode);

    while (!pq.empty()) {
        int u = pq.top().second;
        ll d = pq.top().first;
        pq.pop();

        if (d > cost[u]) continue;

        for (auto &p: adj[u]) {
            int v = p.first;
            int w = p.second;
            if (cost[v] > cost[u] + w) {
                cost[v] = cost[u] + w;
                parent[v] = u;
                pq.emplace(cost[v], v);
            }
        }
    }
}

void run_test_case(int testNum) {
    cin >> n >> m;

    adj.assign(n + 1, {});
```

```cpp
    cost.assign(n + 1, INF);
    parent.assign(n + 1, -1);

    while (m--) {
        // Read Edges
    }

    dijkstra();

    if (cost[n] == INF) {
        cout << -1 << el; // not connected {Depends on you use case}
        return;
    }

    stack<int> ans;
    for (int v = n; v != -1; v = parent[v]) ans.push(v);

    while (!ans.empty()) { // printing the path
        cout << ans.top() << ' ';
        ans.pop();
    }
    cout << el;
}
```

### 7.1.2 Floyd Warshal Algorithm

#### *FloydWarshal Implementation*

```cpp
int main() {
    int n, m; cin >> n >> m;
    vector <vector<int>> adj(n + 1, vector <int> (n + 1, 2e9));
    for (int i = 0; i < n; i++) adj[i][i] = 0;

    while(m--) {
        int u, v, w;
 cin >> u >> v >> w;
        adj[u][v] = min(adj[u][v], w);
        adj[v][u] = min(adj[v][u], w);
    }

    for (int mid = 1; mid <= n; mid++) {
        for (int start = 1; start <= n; start++) {
            for (int end = 1; end <= n; end++) {
```

```
            adj[start][end] = min(adj[start][end], adj[start][mid] +
                adj[mid][end]);
        }
    }
}

 return 0;
}
```

## 7.1.3    Bellman Ford Algorithm

### *BellmanFord Implementation*

```
 vector <vector <pair<int, int>>> &adj

vector <long long> BellmanFord(int src) {
    int n = (int)adj.size();
    vector <long long> dist(n, 2e18);

    dist[src] = 0;
    for (int it = 0; it < n-1; it++) {
        bool in = false;
        for (int i = 0; i < n; i++) { // iterate on the edges
            for (auto &[j, w] : adj[i]) {
                if (dist[j] > dist[i] + w) {
                    in = true;
                    dist[j] = dist[i] + w;
                }
            }
        }
        if (!in) return dist;
    }

    for (int i = 0; i < n; i++) {
        for (auto &[j, w] : adj[i]) {
            if (dist[j] > dist[i] + w) { //negative cycle
                return vector <long long> (n, -1); // or any flag
            }
        }
    }

    return dist;
}
```

## 7.2    Cycle Detection

### 7.2.1    DFS Implementation

### *DFS Implementation*

```
// return true with number of nodes in the cycle, either odd cycle or even
bool cycle_detection(unordered_map<int, vector<int>> &graph, int source,
    int par, unordered_map<int,bool> vis, int c){
    if(vis[source]) return true;

    vis[source] = true;

    for(int v: graph[source]){
     if(v != par){
        c++;
        if(dfs(graph,v, source, vis, c)) return true;
     }
    }
    return false;
}
```

## 7.2.2    Another way for undirected graphs

### *Another way for undirected graphs*

```
// this is true only for undirected graphs
bool dfs1(int cur, int par) {
    bool ret = false;
    vis[cur] = true;
    for (auto &i : adj[cur]) {
        if (!vis[i]) ret|=dfs1(i, cur);
        else if (par != i) ret = true;
    }
    return ret;
}
```

### 7.2.3 General Way

#### *General Way*

```cpp
// general algorithm
vector <bool> cyc;
bool dfs(int cur, int par) {
    bool ret = false;
    vis[cur] = cyc[cur] = true;
    for (auto &i : adj[cur]) {
        if (par == i) continue;
        if (!vis[i]) ret|=dfs(i, cur);
        else if (cyc[i]) ret = true;
    }
    cyc[cur] = false;
    return ret;
}
```

### 7.2.4 DSU Implementation

#### *DSU Implementation*

```cpp
#include <iostream>
#include <vector>

class UnionFind {
public:
    UnionFind(int n) {
        parent.resize(n);
        rank.resize(n, 0);

        cin >> u >> v;
        cout << getDistance(u, v) << el;
    }

//    dfs_accumulate(1, 0);
//
//    for (int i = 1; i <= n; i++) {
//        cout << val[i] << " ";
//    }
//    cout << el;
```

}

---

### 7.3.4    Topological Sort

#### *Topological Sort Using DFS*

```cpp
//REF: USACO Guide
vector<int> top_sort;
vector<vector<int>> graph;
vector<bool> visited;

void dfs(int node) {
 for (int next : graph[node]) {
  if (!visited[next]) {
   visited[next] = true;
   dfs(next);
  }
 }
 top_sort.push_back(node);
}

int main() {
 int n, m; // The number of nodes and edges respectively
 std::cin >> n >> m;

 graph = vector<vector<int>>(n);
 for (int i = 0; i < m; i++) {
  int a, b;
  std::cin >> a >> b;
  graph[a - 1].push_back(b - 1);
 }

 visited = vector<bool>(n);
 for (int i = 0; i < n; i++) {
  if (!visited[i]) {
   visited[i] = true;
   dfs(i);
  }
 }
 std::reverse(top_sort.begin(), top_sort.end());

 vector<int> ind(n);
 for (int i = 0; i < n; i++) { ind[top_sort[i]] = i; }
```

```cpp
// Check if the topological sort is valid
bool valid = true;
for (int i = 0; i < n; i++) {
 for (int j : graph[i]) {
  if (ind[j] <= ind[i]) {
   valid = false;
    goto answer;
  }
 }
}
answer:;

 if (valid) {
  for (int i = 0; i < n - 1; i++) { cout << top_sort[i] + 1 << ' '; }
  cout << top_sort.back() + 1 << endl;
 } else {
  cout << "IMPOSSIBLE" << endl;
 }
}
```

# 8  Techniques

## 8.1  Coordinate Compression

```cpp
void coordinate_compress(vector<int> &x, int start=0, int
    step=1) {
 set unique(x.begin(), x.end());
 map<int, int> valPos;

 int idx=0;
 for (auto i: unique) {
  valPos[i] = start + idx * step;
  ++idx;
 }
 for(auto &i: x) i = valPos[i];

}
```

*Coordinate Compression*

## 8.2  Binary to decimal

*Binary to decimal*

```cpp
// Function to convert binary to decimal
// O(32)
int binaryToDecimal(string str)
{
    int dec_num = 0;
     int power = 0 ;
    int n = str.length() ;

     for(int i = n-1 ; i>=0 ; i--){
     if(str[i] == '1'){
       dec_num += (1<<power) ;
     }
     power++ ;
    }

     return dec_num;
}
```

## 8.3  Decimal to binary

*Decimal to bianry*

```cpp
// Function that convert Decimal to binary
// O(32)
void decToBinary(int n)
{
    // Size of an integer is assumed to be 32 bits
    for (int i = 31; i >= 0; i--) {
        int k = n >> i;
        if (k & 1)
            cout << "1";
        else
            cout << "0";
    }
}
```

```
// O(logn)
string DecimalToBinary(int num)
{
    string str;
      while(num){
      if(num & 1) // 1
        str+='1';
      else // 0
        str+='0';
      num>>=1; // Right Shift by 1
    }
    return str;
}
```

# 9 Number Theory

## 9.1 Divisors

### 9.1.1 formulas

### *number of divisors*

```
int d(int n){
    unordered_map<int, int> factors = pf(n);
    int c = 1;
    for(const auto& factor: factors){
        c *= (factor.second+1);
    }
    return c;
}
```

```
// range Count Divisors backward thinking MAXN = 2e6
  for(int i=1; i <= n; ++i) {
    for(int j = i; j <= n; j += i) {
      numFactors[j]++;
    }
  }

int countDivisors(int n) {
  int count = 0;
```

```
  for (int i = 1; i * i <= n; ++i) {
    if (n % i == 0) {
        if (i == n / i) {
            count++; // Perfect square
        } else {
            count += 2; // Pair of divisors
        }
    }
  }
    return count;
}
```

### *sum of divisors*

```
int s(int n){
    unordered_map<int,int> factors = pf(n);
    int sum = 1;
    for(const auto& factor: factors){
        int p = factor.first;
        int exp = factor.second;
        sum *= (pow(p,exp+1)-1)/p-1;
    }
    return sum;
}
```

## 9.2 Primes

### *prime factorization*

```
void factorize(int x, unordered_map<int, int>& factors) {
    while (x % 2 == 0) {
        factors[2]++;
        x /= 2;
    }
    for (int i = 3; i * i <= x; i += 2) {
        while (x % i == 0) {
            factors[i]++;
            x /= i;
        }
    }
    if (x > 2) factors[x]++;
}
```

## number of co-primes with n

```cpp
int eulerTotient(int n){
    int result = n;

    for(int i = 2; SQ(i) <= n; i++){
        if(n%i == 0){
            while(n%i == 0){
                n/=i;
            }
            result -= result/i;
        }
    }

    if(n > 1) result -= result/n;
    return result;
}

//Phi(n) = n * (1 - 1/P1) * (1 - 1/P2) * ...

//NOTE: summation of Euler function over divisors of n is equal to n
```

## Prime Check

```cpp
vector<bool> isPrime(MAXN, true);

void sieve() {
  isPrime[0] = isPrime[1] = false;

  for (int i=2; i * i <= isPrime.size(); ++i) {
    if(isPrime[i]) {
      for (int j = 2 * i; i <= isPrime.size(); j += i)
        prime[j] = false;
    }
  }
}

bool Prime(int n) {
  if(n == 2) return true;
  if(n < 2 || n % 2 == 0) return false;
```

```cpp
  for(int i=3; i * i <= n; i += 2) {
    if(n % i == 0) return false;
  }
  return true;
}

// Generate Primes
const int sz = sqrt(MAXN);
vector<int> prime;
vector<bool> vis(sz);

void pre() {
    prime.push_back(2);
    for (int j = 4; j < sz; j += 2) vis[j] = true;
    for (int i = 3; i < sz; i += 2) {
        if (vis[i]) continue;
        prime.push_back(i);
        for (int j = i * i; j < sz; j += i) vis[j] = true;
    }
}

// Preprocessing Prime Factorization of range numbers
constexpr int N = 5e6+1;
int a[N];

for(int i=2; i < N; ++i) {
    if(!a[i]) {
        for(int j=1; i*j < N; ++j) {
            for(int k=i*j; k%i==0; k/=i) a[i*j]++;
        }
    }
    a[i] += a[i-1];
}
```

# 10 Geometry

## 10.1 Linearity

### 10.1.1 co-linear points

*check if two points are co-linear*

```cpp
bool co_linear(int x1, int y1, int x2, int y2, int x3, int y3){
  int area = x1*(y2-y3) + x2*(y3-y1) + x3*(y1-y2);
  return area == 0;
}
```

## 10.2 polygons

### 10.2.1 Polygon formation

*check if can form polygon with given angle*

```cpp
bool possible(double angle){
  if(angle <= 0 || angle >= 180) return false;

  double sides = 360.0/(180.0-angle);

  return (sides == static_cast<int>(sides) && sides >= 3);
}
```

### 10.2.2 Rectangle Intersection

*intersection area between 2 rectangles*

```cpp
struct Rectangle {
    int x1, y1; // Bottom-left corner
    int x2, y2; // Top-right corner
};

int intersectionArea(const Rectangle& rect1, const Rectangle& rect2){

    int x_left = max(rect1.x1, rect2.x1);
    int y_bottom = max(rect1.y1, rect2.y1);
    int x_right = min(rect1.x2, rect2.x2);
    int y_top = min(rect1.y2, rect2.y2);

    int intersection_width = x_right - x_left;
    int intersection_height = y_top - y_bottom;

    if (intersection_width > 0 && intersection_height > 0) {
        return intersection_width * intersection_height;
    }

    return 0;
}
```

# 11 Miscellaneous

## 11.1 Faster implementations

### 11.1.1 hashes

*custom hash*

```cpp
#define safe hash unordered_map<type, type, custom_hash> // same for
    gp_hash_table
struct custom_hash {
    static uint64_t splitmix64(uint64_t x) {
        // http://xorshift.di.unimi.it/splitmix64.c
        x += 0x9e3779b97f4a7c15;
        x = (x ^ (x >> 30)) * 0xbf58476d1ce4e5b9;
        x = (x ^ (x >> 27)) * 0x94d049bb133111eb;
        return x ^ (x >> 31);
    }

    size_t operator()(uint64_t x) const {
        static const uint64_t FIXED_RANDOM = chrono::steady_clock::now().
            time_since_epoch().count();
        return splitmix64(x + FIXED_RANDOM);
    }
};
```

### gb hash table

```cpp
//policy based ds (faster hash table)
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
gp_hash_table<int, int> table;
```

## 11.1.2   Binary Search the value

### nearest sqrt

```cpp
long long my_sqrt(long long a)
{
    long long l=0,r=5000000001;
    while(r-l>1)
    {
        long long mid=(l+r)/2;
        if(1ll*mid*mid<=a)l=mid;
        else r=mid;
    }
    return l;
}
```
